Top figure: ROI on the \$150,000 tier. Below it: dollars produced.

Stronger Lighter Still open

Sep 2026 is still open. Its figures are month to date at 14 September 2026 and will be restated when the month closes.

Note. Portfolio account. Deposits and withdrawals reflect monthly profit harvesting, so credit net is negative by design.

WHAT THE RECORD SHOWS

Closed months, all positive	16 of 16
Strongest month	Jul 2025 · 17.59%
Weakest month	Aug 2026 · 1.92%
Average per closed month	6.96%
Peak drawdown on record	-0.3%

WHAT IT DOES NOT PROMISE

16 closed months is a record, not a cycle. A losing month is possible and should be expected at some point. Drawdown control is designed to manage one, not to prevent it, and no figure on this page is a forecast. The account is held at its tier size, so these returns do not compound unless capital is added.

How ROI is calculated. Each month's ROI is that month's realised profit divided by the **\$150,000 tier balance** — a fixed denominator, every month. The account is held at its tier size and profit is withdrawn, so the monthly ROI figures **add**; they are not compounded and not projected. Dollar figures are the account's own realised closed-trade profit and reconcile exactly to its published closed profit of **\$167,547.05**.

Verify it yourself. This record is published independently and continuously on FX Blue, with the full trade history behind it including drawdowns. Nothing here is self-reported. <https://www.fxblue.com/users/voltxx>

Past performance is not indicative of future results. Risk cannot be eliminated — losses can and do occur, and drawdown protection reduces exposure but does not prevent loss. Trading leveraged FX/CFDs involves substantial risk; allocate only capital you can afford to lose. Figures are read from the account's independently published record on the date stated and will change.
